

Control all aspects of your business printing from one machine to any printer server.

Most computing environments aren't homogenous.

If, for example, your business requirements fall outside the standard standalone ScrewDrivers capabilities with printers that are attached to the Terminal Server and accessed by remote users, Simplify Printing is the answer.

Can you be confident that a print job in your network will be delivered to the correct print location quickly and without risk of a system crash? How do you approach an incompatible print driver in your network? What do you do when a user wants to print remotely from an unrecognized printer or print driver?

If you throw yourself into the process of script writing just to accept a single remote printer, there is a more precise, reliable, and less time consuming alternative.

Printing Granularity.

The Simplify Printing Bundle enhances triCerat's ScrewDrivers proven print technology by allowing you to mirror print drivers from the network print server directly to a Terminal Server or virtual machine, bypassing the user's end point entirely. Simplify Printing provides a MSDE/SQL database and Simplify Console in which to manage your print configurations. This allows you to assign print jobs on a granular level based on users, workstations, and groups, integrating with the Windows' Active Directory for centralized access control.

Simplify Printing also enables you to manage and map native printer drivers, increasing the flexibility of system administrators with such requirements. In addition, there is no client-side print delay as all spooling takes place between Terminal Server and print server which reduces end user print backup.
